1 SHANE'S PART 1

1 Shane's Part

In two dimensions, one can model the macroscopic behavior of the system by

$$\frac{\partial \rho}{\partial t} = D\left(\frac{\partial^2 \rho}{\partial^2 x} + \frac{\partial^2 \rho}{\partial^2 y}\right) + \rho(1 - \rho),\tag{1}$$

where $\rho(t, x, y)$ is the density of cancer cell at time t at location (x, y), and D is the diffusion coefficient. One can model the microscopic behavior of the system by

$$dX_t = \sigma dB_t, \tag{2}$$

where $\sigma = \sqrt{2D}$, and B_t denotes a standard two-dimensional Brownian motion, with B(0) = (0,0). Thus,

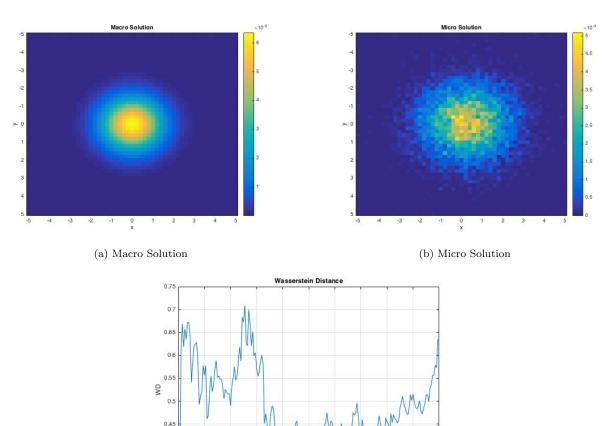

$$\int_{0}^{\Delta t} dX_{t} = \sigma \int_{0}^{\Delta t} dB_{t} \implies x_{\Delta t} - x_{0} = \sigma \mathbf{Z}$$
(3)

where $\mathbf{Z} \sim \mathcal{N}_2((0,0), \Delta t \mathbb{I}_2)$, where \mathbb{I}_p is the $p \times p$ identity matrix. We conclude that

0.35

$$x_{\Delta t} = x_0 + \sigma \sqrt{\Delta t} \mathbf{W},\tag{4}$$

where $\mathbf{W} \sim \mathcal{N}_2((0,0), \mathbb{I}_2)$. In Figures 1a and 1b we plot the level curves of the solution to (1) and (4) respectively. We use $N = 10^4, L = M = 5, \Delta x = \Delta y = .2$ at t = 0, where $x \in [-L, L], y \in [-M, M]$. In Figure 1c, we plot the Wasserstein Distance between the solutions of (1) and (2) as a function of t, where we use $N = 10^3, \Delta t = .05, t = 20, L = M = 2, \Delta x = \Delta y = .5$.

(c) Wasserstein Distance
